General Information

Basecamp:

I agree to my name and email being used to invite me to DEF CON's Basecamp Project Management System if my submission is accepted.

Scheduling:

Ryan is unable to present on Sun, 2026/08/09, as this will be a travel day. Would need to present earlier in the week.

Equipment:

n/a

Agreements:

I have read and agree to the Grant of Copyright Use, Terms of Speaking Requirements, Terms of Speaking Remuneration, Community and Code of Conduct, and Press Agreements.

Biography:

Ryan Chapman is the author of SANS' "FOR528: Ransomware and Cyber Extortion" course, teaches SANS' "FOR610: Reverse Engineering Malware" course, and works as a threat hunter @ \$dayJob. Ryan has a passion for life-long learning, loves to teach people about ransomware-related attacks, and enjoys pulling apart malware. He has presented workshops at DefCon and other conferences in the past and knows how to create a step-by-step instruction set to maximize hands-on learning.

Biography:

Aaron Rosenmund is an accomplished cybersecurity professional with extensive experience in various leadership roles across multiple organizations. Currently serving as the Managing Director of Tradecraft and Programs at OnDefend since September 2024, Aaron also holds a position at the National Guard Bureau as Staff Lead for the Cyber Shield Red Team, demonstrating a commitment to enhancing cybersecurity defenses. With a background that includes significant roles at Pluralsight, where responsibilities spanned content strategy and security skills development, and the Florida Air National Guard as a Lead Cyber Operator focused on defensive operations, Aaron has developed a comprehensive skill set in threat emulation, cyber system operations, and training. Additionally, past leadership positions as CEO at Aestus Industries and Vice President at Concrete Surface Innovations underscore strong management capabilities and operational expertise. Aaron holds multiple degrees in technology and cybersecurity from respected institutions, underscoring a solid educational foundation in this field.

Workshop

Content**Title:**

All About Stoopie InfoStealers: Malware Analysis for Understanding, Custom Coding for True Understanding!

Keywords:

malware, malware analysis, reverse engineering, rem, custom code, infostealer, info stealer

Type:

4 Hour Workshop

Abstract:

Infostealers suck. We all know that. We don't like them. We want you to learn all that you can about them to help thwart the ongoing, ever-evolving threat. On that note, current infostealers are largely rule-based and path-driven, targeting known browser stores and wallets with noisy exfiltration methods. This four-hour workshop, led by Ryan Chapman and Aaron Rosenmund, moves beyond basic comprehension via observation to explore the evolution of precision-based malware. Students will utilize a live, on-demand lab environment to perform deep malware analysis using Ghidra to understand how current stealers operate.

The session then transitions from analysis to creation, where attendees code, compile, and re-build their own "evolved" stealers. We replace static file targeting with in-memory relevance models and trade obvious HTTPS exfiltration for stealthy timing and protocol-native patterns. This hands-on, kinesthetic experience focuses on building a custom arsenal from the ground up. Participants will learn to enhance their tools with behavioral stealth, transitioning from identifying "stoopie" patterns to implementing advanced, AI-driven tradecraft and custom red team tool operations.

You won't just learn how what an infostealer is. You'll learn how they operated end-to-end. Join us :).

Categories:

Malware Analysis and Reverse Engineering

Engagement:

As we've done for the past few years in our DefCon workshops, we will be using a live online environment to provide real-time, on-demand generation of lab environments for each student. Once students log in to the system, they will select to engage in the assigned lab. At that point their range will be built – all students will have their own dedicated malware analysis environment. From the very start of this workshop, students will be interactively compiling and executing a variety of tools and scripts. The entire workshop is based on kinesthetic learning, with our ultimate goal being to teach every student not just how to run commands, but rather how to build out their arsenal from the bottom to the top!

Diversify:

This workshop combines cybercrime tradecraft, malware analysis + building, AI enhancement, and custom red team tool operations through focusing on the current and future states of infostealer malware. We will be teaching people how these stealers work through malware analysis using Ghidra and then have students code, compile, test, enhance, and re-build their own tools.

Experience:

Intermediate

Prerequisites:

(We're stealing a bit from previous years' submissions in this regard, but that's because it's basically the same:)

The primary requirement for this course is a desire to learn and the determination to tackle challenging problems. In addition, having some familiarization with the following topics will help students maximize their time in this course:

- A general background in computing and networking
- Familiarity with blue and/or red team-oriented tools
- An understanding of general networking concepts
- Familiarity with software compilation and/or debugging – though we'll cover everything students need to know

VMs:

No

VMs if Yes:

n/a

Requirements:

- A laptop with Linux/Windows/Mac desktop environment
- Networking capability: Students will be connecting to a remote network range – They will need a wireless NIC (assuming the workshop area provides Wi-Fi – if not we'll need to know) that can be enabled along with administrator privileges on their system
- IMPORTANT: This workshop relies on network connectivity. Any student not able to connect to our range will be unable to follow along with the hands-on portion of the workshop.

Prior Delivery:

Nope! This will be a brand new Ryan & Aaron workshop :).
